Stromag

Founded in 1932, Stromag has grown to become a globally recognized leader in the development and manufacture of innovative power transmission components for industrial drivetrain applications. Stromag engineers utilize the latest design technologies and materials to provide creative, energy-efficient solutions that meet their customer's most challenging requirements.

Stromag's extensive product range includes flexible couplings, disc brakes, limit switches, an array of hydraulically, pneumatically, and electrically actuated brakes, and a complete line of electric, hydraulic and pneumatic clutches.

Stromag engineered solutions improve drivetrain performance in a variety of key markets including energy, off-highway, metals, marine, transportation, printing, textiles, and material handling on applications such as wind turbines, conveyor systems, rolling mills, agriculture and construction machinery, municipal vehicles, forklifts, cranes, presses, deck winches, diesel engines, gensets and stage machinery.

Altra Industrial Motion

Altra is a leading global designer and manufacturer of quality power transmission and motion control products utilized on a wide variety of industrial drivetrain applications. Altra clutches and brakes, couplings, gearing and PT component product lines are marketed under the industries most well known manufacturing brands. Each brand is committed to the guiding principles of operational excellence, continuous improvement and customer satisfaction. Highly-engineered Altra solutions are sold in over 70 countries and utilized in a variety of major industrial markets, including food processing, material handling, packaging machinery, mining, energy, automotive, primary metals, turf and garden and many others.

Altra's leading brands include **Ameridrives**, **Bauer** Gear Motor, **Bibby** Turboflex, **Boston** Gear, **Delroyd** Worm Gear, **Formsprag** Clutch, **Guardian** Couplings, **Huco**, **Industrial** Clutch, **Inertia** Dynamics, **Kilian**, **Lamiflex** Couplings, **Marland** Clutch, **Matrix**, **Nuttall** Gear, **Stieber**, **Stromag**, **Svendborg** Brakes, **TB Wood's**, **Twiflex**, **Warner** Electric, **Warner** Linear and **Wichita** Clutch.

4 BZFM – Electromagnetic Spring-Applied Brake

Applications

- Holding and working brake variations for off shore and industrial applications where high protection against harsh environment is essential
- Usable for windlasses, anchor winches, shipboard cranes, cargo winches, trawler winches

Main features

Coil body with coil	Thermal class 155, nitrocarburated and postoxidated
Armature disc	Special protection: nitrocarburated and postoxidated
Brake disc	Special protection: nitrocarburated and postoxidated
Friction lining	Low wear rate with low torque fade over a high range of temperature. High thermal capacity.
Flange	To IEC standard
Cover	Manufactured of gray cast, from size 400 of seawater protected aluminium
Pinion	Nitrocarburated and postoxidated
Fixing screws	All stainless steel
Flying leads	1,5 metre long, radial or axial
Seals	For high protection

Optional extras

- Micro switch for monitoring switching states or wear detection
- Terminal box
- Standstill heater
- Preparation for speedometer installation

Switching modules

- Half wave or full wave
- Quick switching units
- Built in terminal box
- Attached for mounting into the motor terminal box

4 BZFM – Electromagnetic Spring-Applied Brake

Advantages

- Comprehensive torque range 63 – 11,000 Nm
- Operative without cover
- Type approvals: GL, LRS, ABS, DNV, BV, RR (on request)
- Simple assembly to motor, no dismantling of brake required
- Less wear
- Compatibility of consumable spares
- Simple maintenance, one time wear re-adjustment by reversing of the brake disc
- Proven reliable design
- Sealed inspection holes for air gap or lining wear
- Extremely low inertia
- High heat dissipation
- Free from axial loads when braking and running
- Suitable for vertical mounting, please consult Stromag Dessau GmbH
- Many optional extras available
- Facilities to design to customer's special requirements
- Protection available up to IP 67
- "Asbestos free" linings as standard

Voltages available

- Usual voltage: 24 V DC, 110 V DC, 190 V DC and 207 V DC, other voltages (e.g. 103 V DC) on request.
- Coils available to suit: AC – supplies with integral Half and Full wave rectification.
- We suggest the following alternative - Customer to take standard voltage with rectifier which Stromag Dessau can provide.

4 BZFM – Electromagnetic Spring-Applied Brake

Designation of individual components

- | | |
|----------------------------------------|------------------------|
| 01) Coil body | 11) Cover |
| 02) Friction disc with friction lining | 32) Armature disc |
| 03) Brake disc | 33) Coil |
| 04) Flange | 34) Compression spring |
| 05) Pinion | |

Brake operation

The brake 4 BZFM is a spring-loaded electromagnetic double-face brake which brakes without current and is released electromagnetically.

The brake is screwed to a motor or any other machine part by means of cyl. screws via the flange (04). The coil body (01) contains a coil (33) which is potted with a synthetic resin compound in accordance with thermal class 155, (max. limit of temperature 155°C).

If the coil (33) is not excited, the springs (34) press the armature disc (32) against the friction disc with friction lining (02), which is firmly clamped between the torsion-protected armature disc (32) and the brake disc (03) and thus prevented from rotating. The braking effect is transmitted from the geared friction disc with friction lining (02) via the pinion (05) and a fitting key to the shaft. If the coil is connected to a direct voltage as specified on the nameplate, the magnetic force will draw the armature disc (32) to the coil body (01) overcoming the spring pressure. The friction disc with friction lining (02) is released, the braking effect is cancelled and the brake is released.

4 BZFM – Electromagnetic Spring-Applied Brake

Micro switch

Optional availability, inboard proving switch, one common contact, one normally open contact and one normally closed contact.

This can be interlocked with motor contactor for parking brake duty, i.e. brake release before starting motor.

Brake termination

Three standard versions:

- Flying leads usually 1,5 meter long, axial with a cable bushing and radial through cable gland in flange.
- IP 66 terminal box, for easy connection and removal, at execution with terminal box the brake complies with protection IP 66!
- Versions for AC supply with built-in full wave or half wave rectification inside the terminal box.

Emergency release by means of emergency release screws

For mechanical release in case of emergency or for the adjustment of the system emergency release screws are available.

Flange to IEC

Manufactured to suit your motor on B-side to our brake with IEC connection dimensions.

Standstill heater

Inboard standstill heaters can be provided.

Speedometer installation

If a speedometer connection is required for the brake, the brake cover is provided with connecting bores in accordance with "Euro dimension". The type of protection only maintains when the speedometer is rigidly connected to the cover by means of a flange gland which is sealed by round ring.

Special surface finishes

All components are surface finished with a special surface protection against abrasive environment; e.g. against saline atmosphere on deck, etc..

4 BZFM – Electromagnetic Spring-Applied Brake

Optional Accessories

4 BZFM – Electromagnetic Spring-Applied Brake

Example of designation

Calculations

Figure 1:
The diagram shows the time response of an Electromagnetic Spring-Applied Brake as defined by VDE regulations 0580

4 BZFM – Electromagnetic Spring-Applied Brake

$M_1 =$ Switchable torque [Nm]

The switchable (dynamic) torque is the torque which can be transmitted by a brake under slip condition depending on the friction coefficient and at working temperature. ($M_1 = 0,9M_{SN}$)

$M_3 =$ Synchronization torque [Nm]

The synchronization torque is the torque which arises for a short time after finishing the switching process.

$M_{\bar{u}} =$ Transmissible torque [Nm]

The transmissible (static) torque is the max. torque that can be applied to a brake without the risk of slipping.

$M_{SN} =$ Switchable nominal torque [Nm]

The switchable nominal torque is the dynamic torque as stated in the catalogue at a frictional speed of 1 m/sec.

$M_L =$ Load torque [Nm]

+ M_L for acceleration, – M_L for deceleration. The load torque should always be considered with relative safety factors.

$M_5 =$ No-load torque (drag torque) [Nm]

The no-load torque is the torque which the brake transmits at working temperature when free running.

$M_A =$ Decelerating torque [Nm]

The decelerating torque results from the addition (subtraction for lifting gear during lowering) of the switchable torque and load torque.

Operation times

The operation times shown in the diagram are based on the example of a brake actuated by loss of electrical current. The basic characteristic is also applicable to brakes with alternate methods of operation.

The time delay t_{11} is the time from the instant of de-energization (actuation) to the commencement of the torque build-up (of no importance for d.c. switching). The torque build-up time t_{12} is the time from the commencement of torque build-up to the attainment of 90% of the switchable nominal torque M_{SN} . The switching time t_1 is the sum of the time delay and torque build-up time:

$$t_1 = t_{11} + t_{12}$$

The time delay t_{21} is the time from energization (actuation) to the commencement of the torque will decrease. The fall time t_{22} is the time from the commencement of the torque decrease to 10% of the switchable nominal brake torque M_{SN} . The switching time t_2 is the sum of the time delay and the fall time:

$$t_2 = t_{21} + t_{22}$$

To decrease the switching times of Electromagnetic Spring-Applied brakes, special switching is required.

Please ask for particular information. The switching times stated in the dimensional tables apply to d.c. switching, working temperature and nominal voltage without special switching techniques.

4 BZFM – Electromagnetic Spring-Applied Brake

Nomenclature

A_R	cm ²	Friction surface		
m	kg	Mass		
Q	Joule(J)	Heat quantity		
Q_h	Watt(W)	Heat per hour		
c	$\frac{kJ}{kgK}$	Specific heat	Steel $c = 0,46 \frac{kJ}{kgK}$	Cast iron $c = 0,54 \frac{kJ}{kgK}$
n	rpm	Speed		
t_A	s	Braking time		
t_S	s	Slipping time		

Mass moment of inertia J [kgm²]

The mass moment of inertia J stated in the formula is the total mass moment of inertia of all the masses to be retarded referred to the brake.

Reduction of moments of inertia

The reduction of moments of inertia is calculated from the formula

$$J_1 = J_2 * \left(\frac{n_2}{n_1}\right)^2 \quad [\text{kgm}^2]$$

Moments of inertia of linear masses

The equivalent moment of inertia J_{Ers} for a linear mass m and a velocity v referred to the brake speed n is calculated from the formula

$$J_{Ers} = 91 * m * \left(\frac{v}{n}\right)^2 \quad [\text{kgm}^2]$$

$[v = \text{m/s}] \quad [n = \text{min}^{-1}] \quad [m = \text{kg}]$

Torque considerations for the brake

The mean torque of the driving or driven machine may be calculated from

$$M = 9550 * \frac{P}{n} \quad [\text{Nm}]$$

$[P = \text{kW}] \quad [n = \text{rpm}]$

If the system includes gearing, all torques must be referred to the brake shaft. Depending on the type and functioning of the driving or driven machine resp. shock and peak loads are an important factor for the determination of brake sizes. If precise deceleration times are required a sufficient decelerating torque must already been taken into account when selecting the brake size on the torque rating. Considering the load torque direction, the following switchable nominal torque M_{sn} of a brake is attained (+ M_L for lifting devices when lowering).

$$M_{sn} = M_A \pm M_L$$

4 BZFM – Electromagnetic Spring-Applied Brake

When expressing the decelerating torque M_A by means of the pulse principle, we obtain after corresponding conversion.

Acceleration by load	Brake support by load
$M_A = J * \frac{d\omega}{dt} \quad [\text{Nm}]$	$M_A = J * \frac{d\omega}{dt} \quad [\text{Nm}]$
$M_{SN} = \frac{J * n}{9,55 * t_A} + M_L \quad [\text{Nm}]$	$M_{SN} = \frac{J * n}{9,55 * t_A} - M_L \quad [\text{Nm}]$
$t_A = \frac{J * n}{9,55 * (M_{SN} - M_L)} \quad [\text{s}]$	$t_A = \frac{J * n}{9,55 * (M_{SN} + M_L)} \quad [\text{s}]$

It is assumed that the dynamic torque is achieved instantaneously. Note that the dynamic torque decreases with the speed.

Considerations of dissipated energy

For all operations at speed with slip, dissipated energy is generated in the brake which is transformed into heat. The admissible amount of dissipated energy resp. power capacity must not be exceeded in order to avoid any inadmissible heating. Often the selection of the brake size upon the torque requirement only is not sufficient. Therefore it must always be checked whether the heat capacity of the brake is sufficient.

Generally the dissipated energy in a brake, slipping at time dt with its dynamic torque M_s at an angular speed ω_s is:

$$dQ = M_s * \omega_s * dt$$

With ω_s and conversion by means of the pulse principle the following dissipated energy amount is determined for a single deceleration process with existing load torque

Acceleration by load	Brake support by load
$Q = \frac{M_{SN}}{(M_{SN} - M_L)} * \frac{J * n^2}{182.000} \quad [\text{kJ}]$	$Q = \frac{M_{SN}}{(M_{SN} + M_L)} * \frac{J * n^2}{182.000} \quad [\text{kJ}]$

If a brake slips with constant slipping speed under operation, the dissipated energy is calculated from the formula

$$Q = 0,105 * 10^{-3} * M_s * n_s * t_s \quad [\text{kJ}]$$

Working brake

The brake has to brake a shaft with switching frequency "X" from speed "Y" to speed zero and has to hold it.

Holding brake with emergency stop function

The brake actuates with shaft speed zero and has to hold; in case of emergency, however, it must be able to brake from shaft speed "Y" to zero.

4 BZFM – Electromagnetic Spring-Applied Brake

Permissible heat capacity at 1500 rpm

W [kJ] Switching operations $z \left[\frac{1}{h} \right]$ operations per hour

Figure 2: Heat capacity of series 4 BZFM n =1500 rpm **.

By known operations and number of operations per hour the brake size can be obtained.

Example: W = 100 kJ/operation and z = 10 operations/hour choose the size 4 BZFM 40

** permissible switching operations per switching at other speed ratings on request
